INTRODUCTION

This administrator guide provides a comprehensive overview of setting up and administering a Jellyfin server on RHEL9. Jellyfin is a free and open-source media system that allows the users to organize, stream, and share media content across multiple devices. The goal of the Jellyfin server is to allow for full functional media streaming in an environment accessible from multiple different devices

SERVICE EXPLANATION & IMPLEMENTATION

Jellyfin is a FREE open-source media server software that allows for users to have their media such as music, tv stations, radio stations, videos etc. to be streamed from multiple different devices. It is often considered as a free alternative to using paid subscriptions such as Netflix, Amazon Prime, etc.

1. Enable Red Hat Subscription
2. Remove conflicting packages : `sudo dnf remove firewalld`
3. Download jellyfin from Jellyfin Archive and install with `sudo dnf install`
4. Open port 8096
5. Start and Enable jellyfin with `systemctl`
6. Access Jellyfin VIA `http://100.82.128.70:8096`

FFMPEG INSTALLATION METHOD

FFmpeg is used for media transcoding. We want to compile it because Jellyfin relies on SPECIFIC FFmpeg features. The reason we aren't using dnf install is because the version might be outdated or missing key codecs that Jellyfin needs.

1. Install required build tools (EPEL and RPM Fusion)
2. Enable RPM Fusion and EPEL
3. Download FFmpeg source code with wget <http://ffmpeg.org/releases/ffmpeg-2.3.3.tar.bz2>
4. Configure the build
5. Compile and Install (sudo make install)
6. Verify installation is complete with ffmpeg -version

MAINTENANCE

1. Regularly update packages with : `dnf update`
2. Monitor Jellyfin logs with : `journalctl -u jellyfin`
3. Backup media and config files periodically using cron

Maintenance is important for the server as it allows to ensure it is regularly updated and nothing is broken, as well with regular backups, you can be confident that in the case of a data loss, you will have a way to get it back.

CLIENT DEVICES

Client Device #1 : Windows Host

1. Access VIA browser : <http://100.82.128.70:8096>
2. Login and stream media : username: tomer, password: 123
3. Adjust playback settings as needed

Client Device #2 : iPhone

1. Install Jellyfin app or use safari and connect to ip : <http://100.82.128.70:8096>
2. Login and stream media : username: tomer, password: 123
3. Adjust playback settings as needed
